JQueryWikiWord

Homepage: <http://michaeldaumconsulting.com>

Author(s): Michael Daum

Version: 1.1

This plugin allows to create a WikiWord on the base of a set of input elements. The value of these are concatenated and the result is normalized to be a valid WikiWord. For example, this can be used to derive a topic name from a free-form topic title text.

Foswiki integration

Add the `jqWikiWord` to an html input field and specify the source from which to derive the WikiWord using metadata of the following format:

```
{
  source:'selector', /* e.g. '#projectTitle' */
  initial:'initial value', /* e.g. 'Project...' */
  prefix:'string to be prefixed to the wiki word', /* e.g. 'Project' */
  suffix:'string to be appended to the wiki word' /* e.g. 'AUTOINC0' */
}
```
